Metallicus Inc.

Re: Junior Backend Engineer (Remote)

Dear Metallicus team,

I'm writing to apply for the Junior Backend Engineer role. I've spent the last several years building exactly what your posting describes: service-oriented backends, scalable infra, and crypto products built for real consumers. Metallicus' mission with WebAuth, Metal Pay, and Metal X is where I want to spend the next chapter.

The most relevant proof point is **Splendor App and Splendor Vault** (both live on Google Play), which I created and architected. Splendor lets a user link any Visa, Mastercard, or Amex card and spend from it via Android NFC tap-to-pay, alongside virtual crypto cards for on-chain balances. It's a full stack: an L1 protocol layer, a React Native wallet, a privacy layer, and the mainnet/testnet infrastructure running across 12+ dedicated servers. Designing payment rails that consumers actually understand, exactly Metallicus' premise, is the problem I find most interesting in crypto.

Before that, as Co-Founder & CTO at TreeDeFi, I shipped 25 audited smart contracts managing up to **\$7M TVL** and a launchpad that raised \$87K in under two minutes. The backend was Node.js (ES7+), NestJS, MongoDB, Redis on GCP/AWS/Azure with Docker, GitHub Actions CI/CD, blue-green deploys, monitoring, and secret rotation. Treasury secured via Gnosis Safe multisig and three external audits.

Today, as Technical Lead at Sizelabs, I own microservice architecture for a warehouse AI platform: API contracts, RabbitMQ event flows, Kubernetes on Azure, GitHub Actions pipelines that cut deploy time ~60% and unlocked weekly releases. I introduced PR-level coverage gates and pushed Jest/Mocha test coverage from minimal to 80%+. Test-driven, code-reviewed, observable.

Outside of Sizelabs, I serve as **Cursor Ambassador for LATAM**, running a tri-lingual developer community across English, Spanish, and Italian (Cursor Masterclass Colombia, Cursor Café Medellín and Bogotá, Cursor Meetup Bogotá). The role gives me daily access to Cursor's full premium toolchain and a habit of integrating LLMs into my dev flow at every layer: frontier models for architecture and code review, standard models for high-throughput refactors, agentic loops, and test scaffolding. It directly translates into the kind of weekly-deploy, A/B-tested, well-documented codebase your posting describes.

On the requirements: Node.js (ES7+), SQL/NoSQL (PostgreSQL, MongoDB, Redis), Docker, Kubernetes, Terraform/IaC, multi-cloud, monitoring, secret cycling, and CI/CD across microservices are daily tools. On the bonus side: deep blockchain experience (Solidity, Hardhat, Foundry, ethers.js, LayerZero) and Go services in production. I'm based in Malta as an EU citizen, fully remote, and available 9–4 PT. **On engagement, I'm flexible: I can be onboarded as an independent contractor, or invoice on a B2B basis through my US LLC**, whichever fits Metallicus' vendor process best. No visa sponsorship needed.

I'd love to talk about how Splendor's NFC and crypto-card architecture maps onto Metal Pay, and where I can plug in fastest on the backend.

Thank you for your time,

Niccolò Mascaro
